BRIGHT TV
Viewership Analytics

& Growth Recommendations

Insights and strategies to boost audience engagement, optimise scheduling and grow subscriptions.

LESEGO PUTSOA V.1 • FOR THE CEO & STAKEHOLDERS

GLOSSARY

Key terms and abbreviations

A quick reference for the acronyms, data fields and concepts used throughout this deck.

CVM	Customer Value Management — strategy of growing the long-term value of existing viewers through retention, engagement and personalisation.
SAST	South African Standard Time (UTC+2). All timestamps in this analysis are converted from UTC to SAST.
SQL	Structured Query Language — used to query the viewership_tv and user_profiles_tv tables.
RLS	Row-Level Security — database policies that restrict which rows a user may read or write.
HH:MM:SS	Hours:Minutes:Seconds — the format of the Duration 2 field, converted to seconds for aggregation.
Time of Day	Morning (05–11), Afternoon (12–16), Evening (17–20), Night (21–04) — bucketed from SAST hour.
BrightTV	The streaming platform whose viewership data is being analysed in this report.
UTC	Coordinated Universal Time — the global time standard in which the raw RecordDate2 values are stored.
JOIN	SQL operation linking viewing sessions to user profiles via UserID, enabling demographic analysis.
KPI	Key Performance Indicator — a measurable value that tracks progress against business goals.
Age Groups	Children (<18), Youth (18–35), Adults (36–59), Pensioners (60+) — derived from the Age field.
Churn	When a subscriber stops watching or cancels their subscription — the key risk CVM aims to reduce.

THE OBJECTIVE

Turning viewership data into subscription growth

Strategic Goal

Grow BrightTV subscriptions in a competitive streaming market by deepening engagement and retention.

Data Foundation

Session-level viewership joined with user profiles — UTC times converted to SAST (UTC+2).

CVM Lens

Analytics inform targeted initiatives that increase customer lifetime value and reduce churn.

Outcome

Scheduling, personalisation and off-peak engagement plays tailored to real audience behaviour.

Two datasets, one viewer story

viewership_tv

Viewing Sessions

Each row is a single viewing session — user, channel, start time and duration. Powers all behavioural metrics: who watched, what, when and for how long.

1 row = 1 session

UTC→SAST +2 hours applied

user_profiles_tv

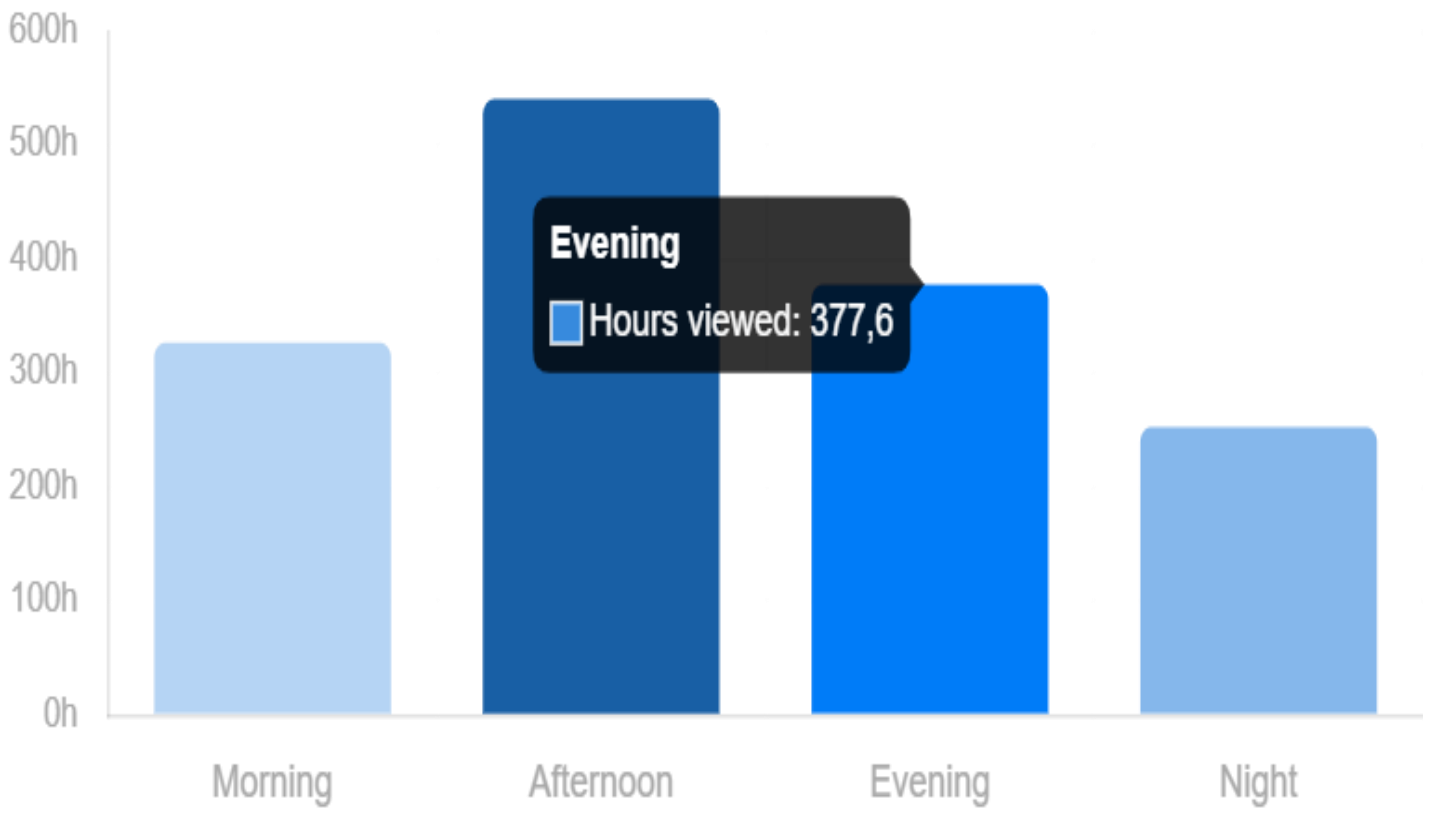
Subscriber Profiles

Demographic context joined to every session — gender, age, province and race. Turns raw viewing into segmented insight.

LEFT JOIN on UserID

4 dims age • gender • province • race

Afternoons spike, evenings hold strong

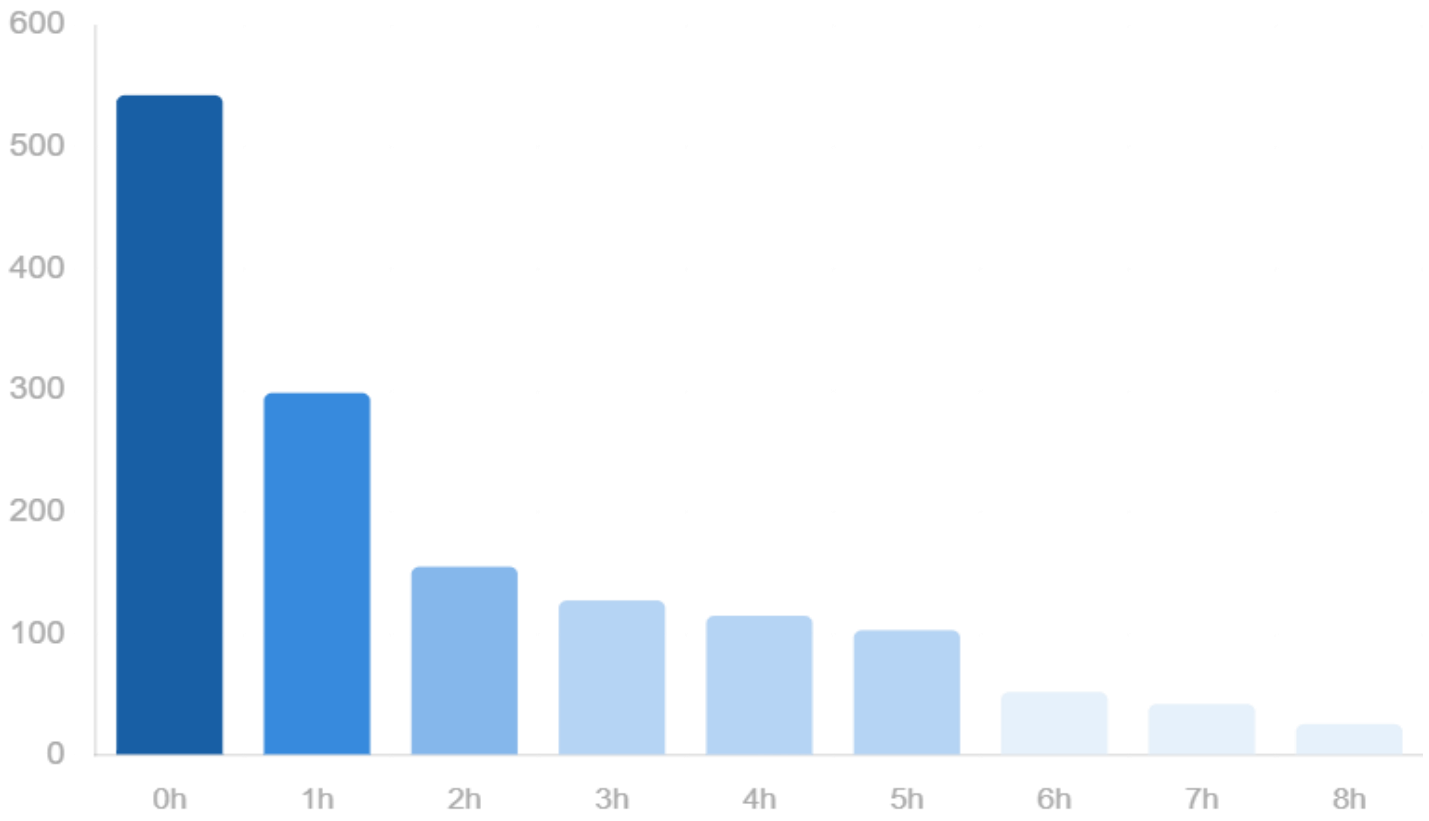


Hours viewed by time of day (SAST)

Key Takeaways

- **Afternoon leads**
  Highest hours of any window — the platform's daily peak.
- **Evening close second**
  377.6 hrs viewed — prime slot for premium and live content.
- **Mornings warm up**
  Steady ~320 hrs — great for catch-up and short-form.
- **Nights are quietest**
  Lowest engagement — opportunity for replays and background play.

Most sessions are short — engagement tails off fast



Distribution of viewing-session lengths (hours)

Short, frequent sessions

- **540+ sessions under 1 hour**

  Viewers dip in and out — modern, on-the-go consumption.

- **~300 sessions in the 1–2 hr range**

  A second healthy cluster of meaningful engagement.

- **Long-form is rare**

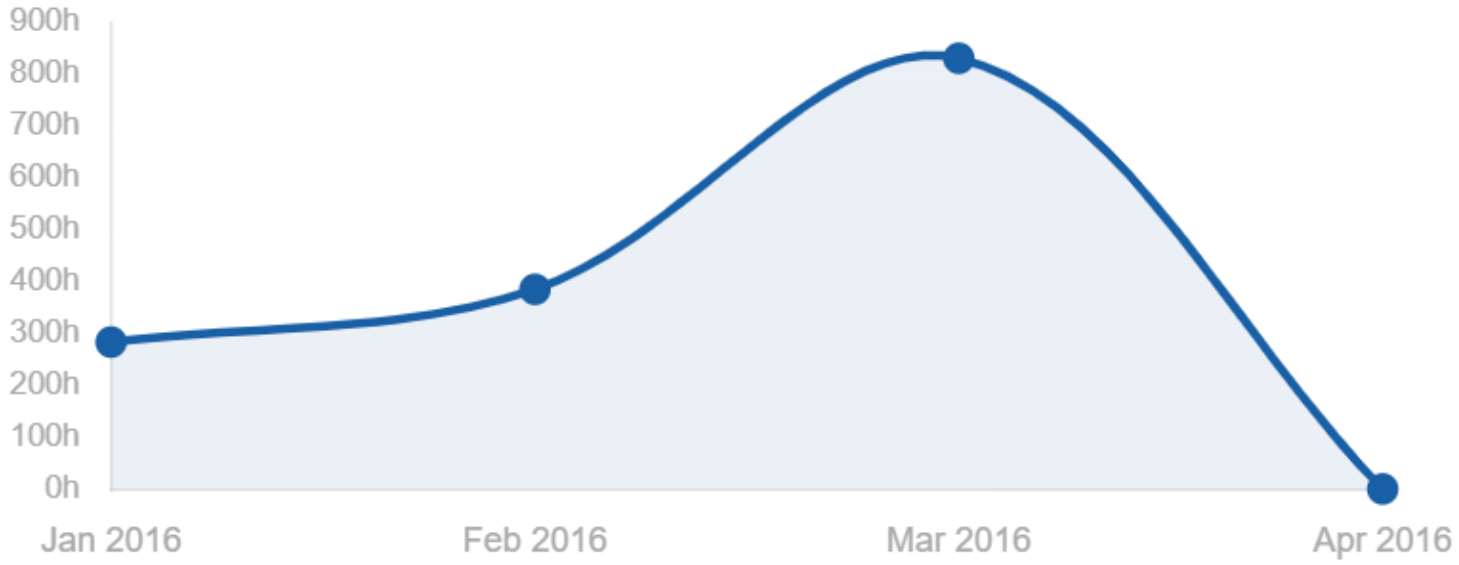
  Beyond 5 hours sessions drop sharply — few binge viewers.

- **Action**

  Optimise highlights, recaps and short-form to match real habits.

MONTH-OVER-MONTH MOMENTUM

Viewership built into March — then dropped sharply



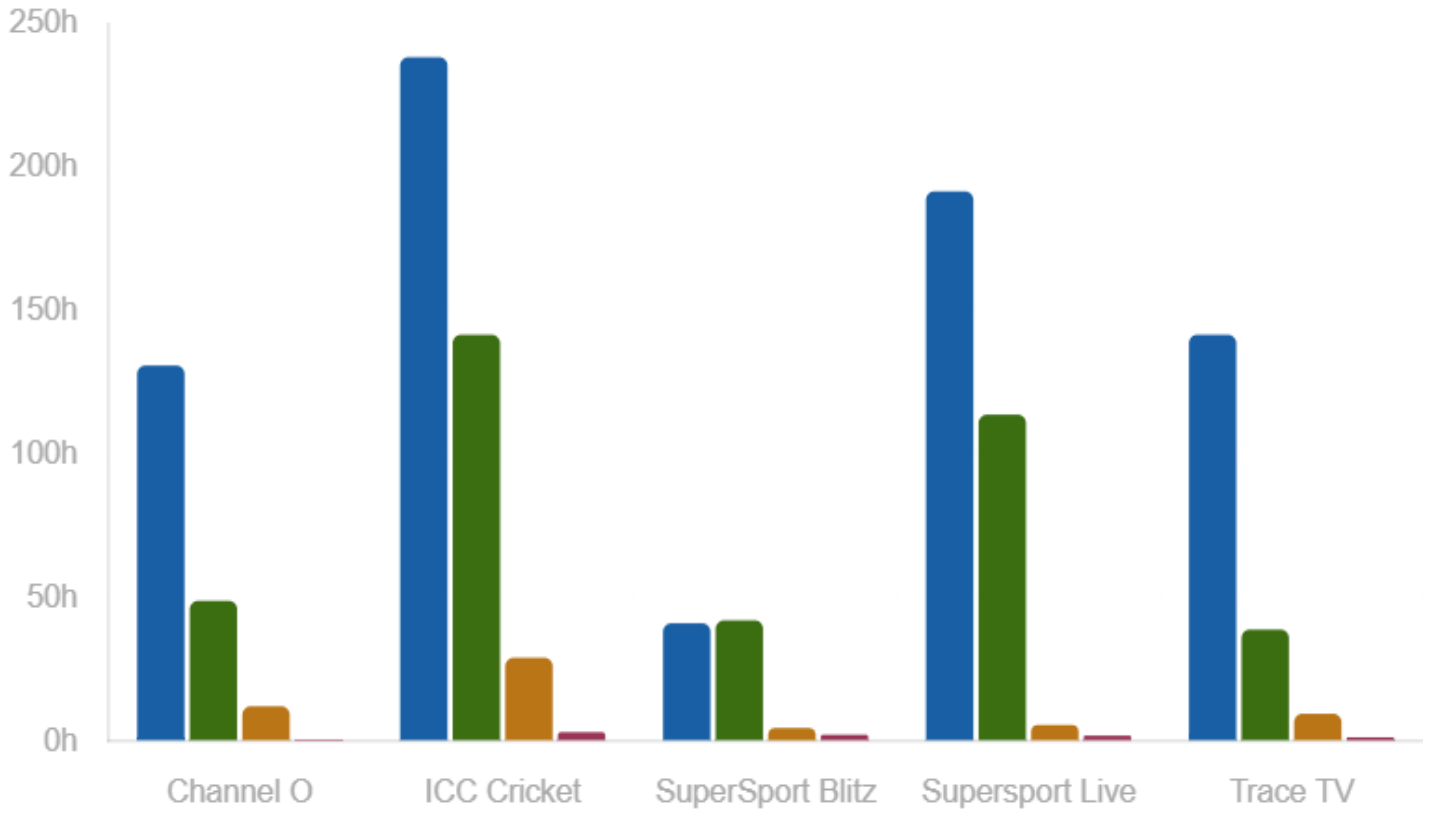
Total hours viewed by month (SAST)

275h	375h	830h	0h
Jan 2016	Feb 2016	Mar 2016 — peak	Apr 2016 — drop-off

What it means

- March is the breakout month — likely event-driven (live sport, premieres).
- The sharp April fall is an early-warning churn signal worth investigating.
- Plan in rolling cycles, not isolated monthly bursts.
- Trigger interventions — push notifications, featured collections — when monthly hours dip.

Sport channels dominate — and the youth lead the way



Hours viewed by channel × age group (youth • adults • pensioners • children)

Audience signals

- **ICC Cricket leads**
  Highest hours overall — a clear flagship engagement driver.
- **SuperSport Live close behind**
  Live sport keeps subscribers watching longest.
- **Youth (18–35) dominate**
  Largest viewing share across every channel — prioritise them.
- **Children & pensioners are light**
  Underserved segments — opportunity for tailored line-ups.

RECOMMENDATIONS

Five plays to grow subscriptions

1

Move from monthly bursts to rolling momentum

Plan in cycles. Use mid-cycle refreshes so March-style peaks aren't followed by April-style drops.

2

Use top channels as platform traffic drivers

Cross-promote lighter channels off ICC Cricket and SuperSport with "if you enjoyed this, try..." placements.

3

Programme to time-of-day behaviour

Short, repeatable content for mornings & nights. Premium and live for the afternoon–evening peak.

4

Personalise by age and province

Lead with youth-focused, sport-rich line-ups; build tailored bundles for under-served pensioners and children.

5

Make performance tracking actionable

Dashboards that flag declining channels, months and time slots automatically — not just report what happened.

Aligned to the CEO's growth objective — engage harder, retain longer, convert more.
